JAFFARSON JS

Software Engineer | Full Stack Developer (Ruby on Rails & React.js)

Salem, Tamil Nadu, India | +91 6369755044 | jaffarsonjs@gmail.com | linkedin.com/in/jaffarson-j-s-b7788938b

PROFESSIONAL SUMMARY

Full Stack Software Engineer with 2+ years of experience designing, building, and scaling enterprise-grade **multi-tenant SaaS platforms** using **Ruby on Rails** and **React.js**. Proven track record building **microservices architectures**, secure **REST APIs**, and real-time systems using **MQTT**, **WebSockets**, and **Redis**-backed background processing with **Sidekiq**. Hands-on experience with **JWT/RBAC authentication**, **Elasticsearch/Searchkick** search infrastructure, **Docker Swarm** containerization, and **AWS** cloud deployment through **GitLab CI/CD** pipelines. Adept at performance optimization, database tuning, and cross-functional collaboration with QA and DevOps in Agile teams. Actively leverages AI-assisted development tools (**Cursor, Claude, ChatGPT, Gemini**) to accelerate delivery, improve code quality, and streamline documentation and debugging workflows.

TECHNICAL SKILLS

Languages: Ruby, JavaScript (ES6+), SQL, HTML5, CSS3

Frameworks & Libraries: Ruby on Rails, React.js, Next.js, Redux, React Router, Tailwind CSS, Bootstrap, HAML, Material UI, Ant Design, Formik, Yup, Styled Components, Express.js

Databases & Search: PostgreSQL, MySQL, Redis, Supabase, Elasticsearch, Searchkick

Backend & APIs: REST APIs, JSON APIs, JWT, OAuth, SSO, RBAC, API Gateway, Sidekiq (Background Jobs)

Cloud & Infrastructure: AWS (S3), Docker, Docker Swarm, Linux, MQTT/Mosquitto, WebSockets, Stripe, Firebase, Graylog, APNs (Apple Push Notifications)

DevOps & Tools: Git, GitLab, GitLab CI/CD, Azure DevOps, Postman, RuboCop, Jira, Slack, VS Code

Architecture & Practices: MVC, OOP, Microservices, Multi-Tenancy, Performance & Database Optimization, Code Review, Agile/Scrum

PROFESSIONAL EXPERIENCE

Software Engineer — Greenbotz Platform Pvt Ltd (*Nov 2024 – Present)*

Project: BiomeX — Multi-Tenant Smart Building Management SaaS Platform

- Engineered and maintained **8+ microservices** within a **multi-tenant SaaS** platform (BiomeX) built on **Ruby on Rails** and **React**, serving building, visitor, parking, and resident management workloads for multiple corporate clients.
- Designed and implemented a centralized **API Gateway** with **JWT-based authentication** and **Role-Based Access Control (RBAC)**, securing access across 8+ backend services and reducing unauthorized-access risk.
- Implemented tenant data isolation using the **Apartment gem**, enabling secure, scalable multi-tenancy across 6+ client organizations on a shared infrastructure.
- Built real-time IoT communication pipelines using **MQTT (Mosquitto)** and **WebSockets** to stream live device and access-control events, improving real-time visibility for facility operations teams.
- Integrated **Elasticsearch** with **Searchkick** to power fast, faceted search across resident, visitor, and asset records, cutting search response times for high-volume tenant datasets.
- Optimized background processing by offloading notifications, report generation, and scheduled jobs to **Sidekiq** with **Redis**, improving API response times and reducing main-thread load during peak traffic.
- Containerized services with **Docker** and orchestrated deployments via **Docker Swarm**, and built automated **GitLab CI/CD** pipelines for staging and production releases, reducing manual deployment effort and release errors.
- Implemented secure file handling and media workflows using **AWS S3**.
- Set up centralized logging and error monitoring with **Graylog**, shortening mean time to detect and resolve production incidents.
- Collaborated cross-functionally with QA and DevOps engineers across the full software lifecycle — feature development, code review, staging validation, and production bug fixes — while occasionally contributing to auxiliary services in **Node.js** and **Go**.
- Used **Stripe** to implement subscription billing and payment workflows for tenant-facing modules

Front End Developer — NeoSME (*Apr 2024 – Nov 2024)*

- Developed responsive, reusable **React** components consumed across multiple product modules, improving UI consistency and cutting new-screen development time.
- Integrated front-end applications with **REST APIs** for authentication, data fetching, and state-driven UI updates, ensuring reliable data flow across the platform.
- Implemented client-side authentication flows and protected routing, improving session handling and reducing unauthorized page access.
- Diagnosed and resolved cross-browser rendering and compatibility issues, improving UI stability across Chrome, Firefox, and Edge.
- Refactored component state management to reduce unnecessary re-renders, improving perceived UI performance on data-heavy screens.
- Partnered with backend engineers and designers in Agile sprints using **Git**-based version control, participating in code reviews, sprint planning, and daily stand-ups.
- Built and maintained a shared component library, reducing duplicate UI code across feature teams.

Part-Time Front End Developer — Investilio AI (*Dec 2025 – Feb 2026)*

- Built interactive **React** dashboards to visualize financial data, including dynamic charts and tables for portfolio and market metrics.
- Integrated **REST APIs** to power real-time data visualization components, ensuring accurate rendering of live financial data.
- Optimized rendering performance of chart-heavy dashboard views, improving load responsiveness on data-dense screens.
- Implemented responsive layouts ensuring consistent dashboard experience across desktop and mobile viewports.
- Identified and fixed UI bugs in data visualization components through close collaboration with the founding engineering team.
- Leveraged **AI-assisted development tools** (Cursor, Claude, ChatGPT) to speed up prototyping and debugging in a fast-moving, early-stage startup environment.

PROJECTS

BiomeX — Multi-Tenant Building Management Platform (Backend)

- Architected core backend services in **Ruby on Rails** using a **microservices** pattern, covering Visitor Management, Parking, Resident Management, IAM, Alerts, Scheduler, Notifications, and Admin modules.
- Designed multi-tenant data isolation with the **Apartment gem** and implemented **RBAC**-driven authorization across all services via a shared **API Gateway**.
- Built real-time alerting and IoT device communication using **MQTT** and **WebSockets**, and implemented searchable resident/asset records with **Elasticsearch** and **Searchkick**.
- Set up background job processing (**Sidekiq**/**Redis**), payment workflows (**Stripe**), and observability tooling (**Sentry**, **Graylog**), all containerized with **Docker** and deployed on **AWS**.

BiomeX — Multi-Tenant Building Management Platform (Frontend)

- Built a modular **React** application with **React Router**-driven, **role-based routing** for distinct tenant, admin, and resident dashboards.
- Designed UI screens for Visitor Management, Parking, Bookings, Complaints, and E-Forms using **Material UI** and **Ant Design**, with form handling via **Formik** and **Yup**.
- Implemented real-time updates using **Socket.IO** and **MQTT**, offline-first data caching with **Dexie**, and secure session handling with **JWT**.
- Integrated **Stripe** billing UI, **Firebase** services, **AWS** asset delivery, along with analytics and scheduling views for facility operations.

EDUCATION

Bachelor of Engineering — Computer Science and Engineering

MERN Stack Development Certification — 12-month program
